

# CCP3 FISH Probe

## Introduction

Chromosome counting probe 3 (CCP3) FISH Probe is designed to detect the copy number of chromosome 3 or to serve as a control to determine the relative number of copies of genes located on chromosome 3 or other chromosomes. The probe is derived from chromosome 3 specific alpha satellite DNA.

Intended Use
To measure the copy number of the human chromosome 3.

Cont.	Color
CCP3 FISH Probe	CytoGreen

## Probe Design

The CCP3 probe hybridizes to chromosome 3 in both metaphase and interphase cells. After hybridizing with normal human peripheral blood lymphocyte samples, two distinct bright fluorescent spots could be observed in the interphase nuclei under a fluorescence microscope. In metaphase cells, bright signals can be observed on the centromere region of chromosome 3 (3p11.1-q11.1). No cross-hybridization to loci on other chromosomes is observed.

Not to Scale

Cat. No.	Volume
CT-CCP003-10-G	10 Tests (100 µL)

Signal Pattern Interpretation	
<u>Normal Pattern</u>	<u>Abnormal Pattern</u>
2G	Other Patterns
