CCP12 FISH Probe

Introduction

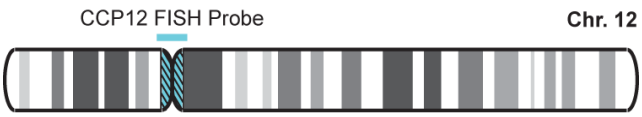
Chromosome counting probe 12 (CCP12) FISH Probe is designed to detect the copy number of chromosome 12 or to serve as a control to determine the relative number of copies of genes located on chromosome 12 or other chromosomes. The probe is derived from chromosome 12 specific alpha satellite DNA.

Intended Use

To measure the copy number of the human chromosome 12.

Cont.	Color
CCP12 FISH Probe	CytoAqua

Probe Design



Not to Scale

The CCP12 probe hybridizes to chromosome 12 in both metaphase and interphase cells. After hybridizing with normal human peripheral blood lymphocyte samples, two distinct bright fluorescent spots could be observed in the interphase nuclei under a fluorescence microscope. In metaphase cells, bright signals can be observed on the centromere region of chromosome 12 (12p11.1-q11.1). No cross-hybridization to loci on other chromosomes is observed.

Cat. No.	Volume
CT-CCP012-10-A	10 Tests (100 µL)

Signal Pattern Interpretation

Normal Pattern	Abnormal Pattern
2A	Other Patterns
