ChromoLympho B Proliferation Mix

REF EKAMP010M Q.ty 50 tests

ChromoLympho B Proliferation Mix contains both ChromoLympho-B Proliferation Factor and IL2 (Recombinant Human Interleukin-2) premixed and lyophilised in one vial, ONE VIAL=ONE TEST.

ChromoLympho-B Proliferation Factor is a "new generation" proliferation reagent that used together with IL2 in cultured peripheral blood/bone marrow cells from patients affected with chronic lymphocytic leukaemia (CLL) and other B-cell lymphoproliferative syndromes, has proved a very high success rate of metaphase analysis and more importantly, an impressive Abnormality Rate similar to Fish analysis findings.

Features

-  1 tube with ChromoLympho-B Proliferation Factor (10nmol), and IL2 (500IU), yeast source
-  Tested for *in vitro* culture of PB/ bone marrow cells
-  To be used on samples from patients affected with CLL and other B cell lymphoproliferative disorders
-  Lyophilised: very stable; long shelf life: 12 months at -20°C.
-  User friendly and fast protocol
